Export and Import WordPress Content

Website Content · https://wiweka.dev/tutorial/website-content/export-and-import-wordpress-content/

WordPress is the world’s most popular content management system and is a trusted platform for businesses to create and manage their websites. While WordPress offers a lot of features and content options, one thing it doesn’t provide is the ability to easily export and import content. This means that, if you need to migrate your content from one site to another, then you’ll need to export and import your content manually.

Exporting Content from WordPress

To export content from WordPress, you will first need to navigate to the ‘Tools’ tab in the WordPress dashboard. From there, you will be able to choose which type of content you would like to export. This includes posts, pages, comments, media files, and custom fields. Once you’ve made your selection, you will be able to download a .xml file containing your content. This .xml file can then be uploaded to another WordPress website to import your content in one quick and easy step.

Importing Content into WordPress

Now that you’ve exported your content, you should be able to upload it into another WordPress website. To do this, you will need to navigate to the ‘Tools’ tab in the new website’s dashboard. From here, you will be able to select the ‘Import’ option. You will then be asked to choose which type of file you are importing. Select the relevant .xml file from your downloaded content and follow the instructions. Once the process is complete, your content should now be available on your new website.

Manually Exporting and Importing Content

If you don’t have access to the ‘Tools’ tab or the export/import option just described, then you can manually copy and paste your content from one WordPress site to another. To do this, you will need to have access to both the WordPress dashboard of both websites. Copy and paste content from one

website’s ‘Posts’ or ‘Pages’ sections into the other website’s corresponding posts or pages. Do the same for categories, tags, images, and other media assets as necessary. Once the content has been copied and pasted, it should now be available on your new website.

Conclusion

WordPress provides an easy and convenient way to export and import content from one website to another. With the ‘Tools’ tab, you can easily download a .xml file containing your content for uploading to a new site. However, if this feature is not available, you can copy and paste content manually from one WordPress website to the other. If you follow these instructions, you should have no problem transferring your content with ease.
