WordPress Discussion Setting

Website Settings · https://wiweka.dev/tutorial/website-settings/wordpress-discussion-setting/

WordPress is one of the most popular content management systems that allows users to control their own websites and blogs. It provides a platform for easy creation of content while giving users access to a wide variety of third-party plugins, themes, and widgets. One key feature in WordPress is the ability to customize the comments section, allowing users to determine how and when comments on articles and posts are enabled or disabled.

What are WordPress Discussion Settings?

WordPress discussion settings provide an easy means of allowing readers to comment on blog posts and articles. The settings allow you to configure the process for validating and publishing comments, enabling comment moderation and spam removal filters, and determining the fields that each commenter must fill out in order to post a comment. These settings can give you complete control over who can comment on your content, and how those comments will be managed and published.

Steps to Setup Discussion Settings in WordPress

The following steps provide guidance on how to configure comment settings for a WordPress website:

1. **Go to the settings page:** Log in to WordPress and go to 'Settings' > 'Discussion'. This will take you to the general settings page for remarks on your website.
2. **Enable/Disable Comments:** From here, you can check the box to choose to enable comments site-wide. This allows visitors to comment on your content. You can also uncheck the box to turn comments off entirely.
3. **Email adress:** If you have enabled comments, input your email address in the 'Notification email' field. This helps you keep track of user comments and respond to them in a timely manner.
4. **Comment Moderation:** This will allow you to specify a list of keywords that can be used to detect comments that are attempting to spam your website. Selecting the “Users must be registered and logged in to comment” checkbox will require visitors to be signed in to comment.

5. **Comment Blacklist/Whitelist:** This allows you to specify a list of keywords that can be used to detect comments that are attempting to spam your website. Alternatively, you can create a whitelist with email addresses of users that you want to be able to comment.
6. **Comment Settings:** This page allows you to configure the format of the comments page and specify which fields are required for comments. You will also be able to enable or disable comment pagination and sorting, as well as display an avatar next to each comment.
7. **Save settings:** Once you are satisfied with your settings, click the 'Save Changes' button to save the changes and apply the new settings to your WordPress website.

Configuring comment settings in WordPress is a fairly simple process and should only take a few minutes. With the right configuration, you can better manage the conversations on your website, and ensure that your content remains relevant and insightful.
